

METHOD, SYSTEM AND COMPUTER PROGRAM PRODUCT FOR GENERATING AND PROCESSING A DISPOSABLE EMAIL ADDRESS

Abstract of the Disclosure

Disposable email address generation, and processing thereof at a disposable address system are provided. The generated disposable email address includes a hostname domain, a username, a domain tag, and a passcode, wherein the passcode is selected by a user employing a user chosen algorithm of a plurality of passcode validation algorithms provided to the user by the disposable address system. The user chosen algorithm for generating the passcode can be periodically changed for different disposable email addresses owned by the user. The disposable address system includes storage for holding an indication of revocation of a compromised disposable email address to prevent future emails with that destination email address from being forwarded to the user owning the email address.
